

MediConnect User Stories and Acceptance Criteria

Organized by FR-01 through FR-11

Prepared from the MediConnect Functional Requirements baseline

Document Scope

This PDF translates the functional requirements for the MediConnect Healthcare Prior Authorization and Interoperability Platform into user stories with acceptance criteria beneath each story. It preserves the FR structure from the source requirements and keeps the wording practical for business analysis use.

FR-01: User Access and Role Management

FR-01 - US-01: Access System by Role

As a provider, care coordinator, billing staff member, or administrator, I want to access the system according to my assigned role so that I can use the appropriate features and information.

- User can sign in with valid credentials.
- System identifies the user's assigned role.
- User can access only features and information allowed for that role.
- Unauthorized features and data remain restricted.
- Access is limited to the user's assigned organization.

FR-01 - US-02: Create User Account

As an administrator, I want to create a user account so that a new user can access the system according to their role.

- Administrator can create a new user account.
- Administrator can assign a role to the user.
- Account is associated with the correct organization.
- System saves the account successfully.

FR-01 - US-03: Update, Disable, and Audit User Account

As an administrator, I want to update or disable user accounts and review account activity so that access remains accurate and controlled.

- Administrator can view existing user accounts.
- Administrator can update account details.
- Administrator can disable a user account when needed.
- System records account changes in an audit trail.

FR-02: Patient and Case Intake

FR-02 - US-01: Create Prior Authorization Case

As a PA coordinator, I want to create a new prior authorization case manually or from an incoming EHR referral so that the patient and authorization information can be prepared for processing.

- User can create a case manually.
- User can create a case from an incoming EHR referral.
- Case is linked to the correct patient record.
- System assigns a unique case identifier.

FR-02 - US-02: Capture Patient and Insurance Details

As a PA coordinator, I want to capture patient demographic and insurance information so that the authorization request contains the required case details.

- System captures patient demographic data required for submission.
- System captures payer, plan, policy, and member information.
- Required fields can be reviewed before the case moves forward.

FR-02 - US-03: Preserve Case Identifier

As a care team member, I want the case identifier to stay consistent across transactions so that the request can be tracked end to end.

- System generates or preserves a unique case ID.
- The same case ID is used across downstream transactions.
- Case ID remains associated with the patient and request history.

FR-03: Clinical Data Acquisition

FR-03 - US-01: Receive Clinical Data from EHR

As a coordinator, I want the system to receive clinical data from the hospital EHR so that the authorization case can be supported with current clinical information.

- System receives clinical data through standardized integration interfaces.
- Clinical data is linked to the correct patient or case.
- Inbound data is stored for authorization processing.

FR-03 - US-02: Ingest Required Clinical Elements

As a coordinator, I want the system to ingest diagnosis, procedure, medication, allergy, note, and documentation data so that supporting evidence is available for review.

- Diagnosis codes are captured.
- Procedure codes are captured.
- Medications are captured when available.
- Allergies are captured when available.
- Notes and supporting documents are captured when available.

FR-03 - US-03: Validate Clinical Completeness

As a coordinator, I want required clinical fields to be validated before submission so that incomplete requests are not sent to the payer workflow.

- System checks for required clinical fields.
- Missing required data is flagged before submission.
- Case cannot proceed until required data issues are addressed.

FR-04: HL7 Integration

FR-04 - US-01: Accept HL7 Messages

As an integration user, I want the system to accept HL7 messages from the hospital EHR so that inbound data can be processed reliably.

- System accepts inbound HL7 messages.
- Messages are associated with the correct patient or case record.
- Message processing outcome is stored.

FR-04 - US-02: Validate HL7 Structure

As an integration user, I want malformed HL7 messages to be rejected with a clear error so that bad data does not enter the workflow.

- System validates HL7 message structure.
- Malformed messages are rejected.
- Error message is actionable for troubleshooting.

FR-04 - US-03: Log HL7 Activity

As an auditor, I want inbound and outbound HL7 activity logged so that message handling can be traced later.

- System logs inbound HL7 activity.
- System logs outbound HL7 activity.
- Logs include traceable message details.

FR-05: HL7 to FHIR Transformation

FR-05 - US-01: Transform HL7 to FHIR

As an integration user, I want supported HL7 data elements transformed into FHIR resources so that downstream processing can use the standardized structure.

- Supported HL7 elements are mapped to FHIR resources.
- Transformation supports downstream processing needs.
- Converted data is available for later workflow steps.

FR-05 - US-02: Map Core Clinical Data

As a downstream system user, I want patient, encounter, condition, observation, and document data mapped correctly so that the clinical record is complete in FHIR form.

- Patient data is mapped to the proper FHIR structure.
- Encounter data is mapped to the proper FHIR structure.
- Condition data is mapped to the proper FHIR structure.
- Observation data is mapped to the proper FHIR structure.

- Document data is mapped to the proper FHIR structure.

FR-05 - US-03: Flag Unmapped Data

As an analyst, I want unmapped or incomplete data elements flagged for review so that nothing is silently lost.

- Unmapped elements are flagged.
- Incomplete elements are flagged.
- Data is not silently dropped without review visibility.

FR-06: FHIR API Services

FR-06 - US-01: Expose FHIR APIs

As a consuming system, I want FHIR-based APIs for patient and authorization data so that systems can exchange information using standard interfaces.

- FHIR-based APIs are available.
- APIs support patient and authorization data exchange.
- API endpoints follow the solution design.

FR-06 - US-02: Support CRUD and Query Operations

As a consuming system, I want create, read, update, and query operations for authorization-related FHIR resources so that records can be managed programmatically.

- System supports create operations.
- System supports read operations.
- System supports update operations.
- System supports query operations.
- Supported resource behavior follows the solution design.

FR-06 - US-03: Return Standard API Responses

As an integration consumer, I want standardized API responses so that success, validation errors, and processing states are clear.

- System returns success responses for valid requests.
- System returns validation error responses for invalid requests.
- System returns downstream processing state when applicable.

FR-07: Prior Authorization Workflow

FR-07 - US-01: Create Authorization Request

As a PA coordinator, I want to create a prior authorization request from available clinical and insurance data so that the case can be submitted to the payer.

- Request is created from available clinical data.
- Request is created from available insurance data.
- Request is ready for payer routing.

FR-07 - US-02: Route to Correct Payer

As a PA coordinator, I want the request routed to the correct payer based on plan and payer rules so that submission reaches the right destination.

- System evaluates plan and payer rules.
- Request is routed to the correct payer.
- Routing choice is tied to the case record.

FR-07 - US-03: Track Authorization Status

As a care team member, I want the request to move through standard authorization states so that I can understand the case progress.

- System supports Draft status.
- System supports Submitted status.
- System supports Pending Review status.
- System supports Approved status.
- System supports Denied status.
- System supports More Information Required status.

FR-07 - US-04: Add Supplemental Documents and Resend

As a PA coordinator, I want to add supplemental documents and resend the request when more information is needed so that the payer can complete review.

- User can attach supplemental documents.
- User can resend the request after updates.
- Updated submission remains linked to the same case.

FR-08: Payer Response Handling

FR-08 - US-01: Receive Payer Decisions

As a coordinator, I want the system to receive payer decisions and store them on the authorization case so that the outcome is preserved.

- System receives payer decisions.
- Decision is stored against the correct case.
- Case history reflects the payer outcome.

FR-08 - US-02: Handle Approval, Denial, and More Info Requests

As a care team member, I want payer responses for approval, denial, and additional information to be handled consistently so that next steps are clear.

- Approval responses are supported.
- Denial responses are supported.
- More information responses are supported.

FR-08 - US-03: Capture Payer Details

As an analyst, I want payer reasons, remarks, and next-step instructions captured so that the response can be reviewed and acted on.

- Payer reasons are stored when provided.

- Payer remarks are stored when provided.
- Next-step instructions are stored when provided.

FR-09: EHR Status Updates and Notifications

FR-09 - US-01: Send Status Updates to EHR

As an integration user, I want authorization status updates sent back to the hospital EHR so that the clinical record stays current.

- System sends authorization status updates to the EHR.
- Update is linked to the associated case.
- Transmission outcome is tracked.

FR-09 - US-02: Notify Relevant Users

As a user, I want to be notified when a case changes status or needs action so that I can respond in time.

- Notifications are triggered on status change.
- Notifications are triggered when action is required.
- Relevant users receive the notification.

FR-09 - US-03: Support Key Event Notifications

As a user, I want notifications for approval, denial, missing information, and transmission failure so that important events are not missed.

- Approval notifications are supported.
- Denial notifications are supported.
- Missing information notifications are supported.
- Transmission failure notifications are supported.

FR-10: Audit Trail and Tracking

FR-10 - US-01: Maintain Audit Trail

As an auditor, I want the system to maintain an audit trail for case creation, updates, submission, response handling, and user actions so that activity can be reviewed later.

- Audit trail captures case creation.
- Audit trail captures case updates.
- Audit trail captures submission events.
- Audit trail captures response handling events.
- Audit trail captures user actions.

FR-10 - US-02: Capture Transaction Details

As an auditor, I want timestamps, user identifiers, message identifiers, and status transitions stored for each transaction so that the case history is complete.

- Timestamps are stored.
- User identifiers are stored.
- Message identifiers are stored.

- Status transitions are stored.

FR-10 - US-03: View Case History

As an authorized user, I want to view the history of a case from intake through final decision so that I can understand the full lifecycle.

- Authorized users can view case history.
- History includes intake events.
- History includes final decision details.

FR-11: Reporting and Monitoring

FR-11 - US-01: Operational Reporting

As a manager, I want operational reports for volume, turnaround time, approval rate, denial rate, and pending cases so that I can monitor performance.

- Reports include case volume.
- Reports include turnaround time.
- Reports include approval rate.
- Reports include denial rate.
- Reports include pending cases.

FR-11 - US-02: Identify Stalled or Incomplete Cases

As a manager, I want stalled cases and cases missing required information identified so that follow-up can happen quickly.

- Stalled cases are identified.
- Cases missing required information are identified.
- Identified cases are visible for follow-up.

FR-11 - US-03: Export Reports

As a manager, I want exportable reports for operational review and management analysis so that I can share or archive the data.

- Reports can be exported.
- Export supports operational review.
- Export supports management analysis.

Requirement Summary Matrix

FR-01: User Access and Role Management

FR-02: Patient and Case Intake

FR-03: Clinical Data Acquisition

FR-04: HL7 Integration

FR-05: HL7 to FHIR Transformation

FR-06: FHIR API Services

FR-07: Prior Authorization Workflow

FR-08: Payer Response Handling

FR-09: EHR Status Updates and Notifications

FR-10: Audit Trail and Tracking

FR-11: Reporting and Monitoring
